

Ecommerce data report

A concise, evidence-led readout of the visible dashboard signals, with uncertainty kept in view.

READ THIS FIRST

The dashboard is clearest as a directional retention signal.

It highlights where customer attention may be concentrated now; it does not replace a reconciled export or a fully legible source dataset.

Source basis

Dashboard image

Printed values preserved. Approximate chart readings labeled.

The dashboard points to a concentrated retention problem.

The visible mix is led by customers who are dormant, at risk, or already lost.

LARGEST CLEARLY LABELED PORTIONS

82%

Across About to Sleep, Lost Customers, and At Risk.

The three visible segments account for the largest clearly labeled portions of the mix: **34%**, **28%**, and **20%**, respectively.

WHAT THE IMAGE SUPPORTS

Retention needs attention

The visible mix is weighted toward customers needing reactivation or recovery.

Read directionally

These are dashboard readings, not a reconciled source-of-truth dataset.

Validate before acting

Pair the image with the underlying export before setting targets or budget.

Four headline metrics anchor the readout.

These are the values printed in the dashboard. One identifier tile requires special care: its printed total may represent an aggregate or average rather than a customer count.

METRIC	PRINTED VALUE	CONFIDENCE NOTE
Total of Column1	9,594,390	Printed in dashboard
Total CustomerID	669,895.66	Printed; interpretation unclear. May be an aggregated or averaged identifier rather than a customer count.
Total of Frequency	407,755	Printed in dashboard
Total of Monetary	1,411,472.154	Printed in dashboard

Reading rule. Preserve the printed values, but do not infer units, customer counts, or business meaning that the dashboard does not make explicit.

About to Sleep is the largest visible customer segment.

The customer mix is concentrated in three clearly labeled groups, with smaller shares assigned to loyal, new, and attention-needed customers.

Customer segment

About to Sleep leads at 34%.

Lost Customers follows at 28%, then At Risk at 20%.

Loyal Customers is 9%; Need Attention is 3%.

Chart note

Two small slices are not confidently assigned in the source image.

Frequency appears highest for At Risk customers.

The line chart suggests a directional peak for At Risk and a low point for New Customers; the image contains no printed data labels.

Use the shape, not the decimal.

At Risk appears highest while New Customers appears lowest. The plotted values are estimated readings from the source image and should not be used for precise decisions.

CONFIDENCE

Directional

No printed chart labels.

What leadership can conclude now.

The evidence supports a retention and reactivation focus—before fine-grained forecasting.

01 The visible mix is weighted toward risk.

About to Sleep, Lost Customers, and At Risk dominate the clearly labeled customer segments, while loyal and newly acquired groups are smaller.

02 Retention deserves attention first.

The strongest signal is directional: reactivation and retention should be examined before the dashboard is used for fine-grained forecasting.

03 Source resolution limits certainty.

The image does not provide enough resolution to validate every category value or map-level pattern. Approximate chart readings remain approximate.

RECOMMENDED NEXT STEP

Pair this report with the underlying export.

Use the dashboard as a decision-oriented readout, then validate definitions, units, category totals, and customer-level records before committing budget or targets.

**Validate
then act.**
